

How to Fix iMac Power Protection Mode

Power Protection Mode is a state that iMacs will sometimes enter if there is an electrical fluctuation or power outage. If your iMac will not power on after pressing the power button, the following steps could easily fix the problem.

1. Unplug the white power cable from the back center of the iMac.

2. While still unplugged, hold the power button for 5 full seconds and let go.

3. Plug the power cable back in and **wait 5 full additional seconds.**

4. Firmly press the power button once. Your iMac should power on within a few seconds.

If your iMac is still not powering on, please create a help desk ticket with the tech department and we will assist you as soon as possible.
